Option 1 : Total error in latitude or departure  $\times$  length of that side/perimeter of traverse  
 Free 30 Questions 30 Marks 30 Mins Adjustment of traversing: 1.Arbitrary Method: Measurement are adjusted by surveyor on his experience based. 2. Bowditch Method: It is done when both linear and angular measurement with highly accuracy. According to Bowditch rule, error in linear measurement are directly proportional to square root of length of line and error in angular measurement are inversely proportional to square root of length of line. 
$$\text{Correction} = \frac{\text{total error in latitude or departure}}{\text{length of that side}} \times \text{length of that side}$$
 3. Graphical Method: It is based on bowditch rule. It generally used in compass traversing. 4. Transit Method: It is done when angular measurement is more accurate than linear measurement in traversing. In this method only linear measurement affected. 5. Axis Method: In this method, correction is applied only in length. It is done when angular measurement is more precise. Synonyms: Bowditch Rule, Compass Rule Anthony Iaquinto and Stephen Spinelli Jr. stampede a sizable herd of entrepreneurship's sacred cows in Never Bet the Farm (Jossey-Bass, \$19.95). They declare there is no one entrepreneurial personality and say that entrepreneurs are people just like everybody else. They ascribe a much larger role than most experts do to luck—both good and bad—in the way entrepreneurial ventures turn out. Perhaps their most controversial suggestion is that entrepreneurs operate at times in “the gray”—an area between established rules and unethical behavior. As examples, they provide cases of retailers jousting with regulators and startups using smoke and mirrors to appear larger than they are.
