Ubuntu is a complete Linux operating system, built and supported by both professionals and the community. It is completely free and will run on any desktop or computer laptop. Canons, people behind the Ubuntu project, are also working to bring the same experience to mobile devices such as phones and tablets. Ubuntu is trying to unify mobile phone and experience of the Ubuntu and Android desktop have a long history. In fact, Google people who write and build Android use Ubuntu to do so. With the latest versions of Ubuntu, the same software (using the same installation package) runs on servers, desktop workstations, laptops, tablets and phones. Including different Android models. Canonical is also working with partners like T-Mobile and EE to bring the Ubuntu mobile devices market. This was originally planned to be Ubuntu on top of Android has become a native mobile operating system at the same time. Share a common Linux heritage with Android, the Developers should feel at ease when designing hardware and software for Ubuntu phones. Both the BQ of Spain and the Giant Meizu Chinese have signed as a hardware partner, and we should see the first phones powered by Ubuntu in the near future. Source: Windows Central Use An Android app to transform the phone into a system monitor. Keep track of the temperatures and use of your system. Completely free To use, apart from the widget dashboard. Monitor PC system resources and other values such as temperatures and voltages requires third-party software such as HWInfo where you can have a window or overlap configured for viewing. But not everyone has five monitors, nor desire to have a text group that covers your screen while playing a game. It here comes into Android game of the remote system monitor. As shown by Reddit User DIV2691, and identified by PCGamesN, this practice practice allows you to perform some software on the PC to act as a server and install an Android app as a client. It is therefore possible to take a look at temperatures, uses and all the rest reported by the sensors. The best part is this is all free. You need to make a small donation to enjoy the widget dashboard, however, that you will allow you to transform your Android phone into a dashboard of sorted system resources (as in the picture above). Once configured with the server and the PC widgets, you will be able to create something unique on your desk. Better yet, if you have an old phone lying around the collection of dust, because don't use a USB cable to keep it uploaded, install it inside your PC case and have a monitor screen always on you can quickly use to see what Is it happening with your rig? There are many other ways to monitor PC resources, including the use of raspberry pi, but not everyone has time nor the know-how, which makes app like this a useful consideration.
